 release v2023.4

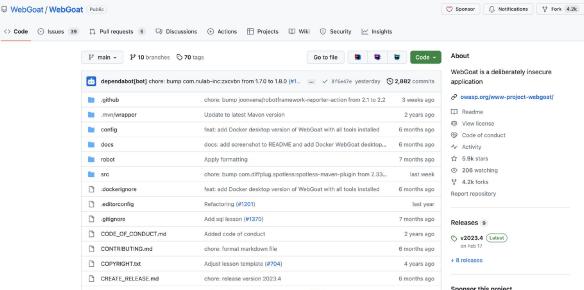

Learn the hack - Stop the attack

WebGoat is a deliberately insecure application that allows interested developers just like you to test vulnerabilities commonly found in Java-based applications that use common and popular open source components.

Description

Web application security is difficult to learn and practice. Not many people have full blown web applications like online book stores or online banks that can be used to scan for vulnerabilities. In addition, security professionals frequently need to test tools against a platform known to be vulnerable to ensure that they perform as advertised. All of this needs to happen in a safe and legal environment.

Even if your intentions are good, we believe you should never attempt to find vulnerabilities without permission. The primary goal of the WebGoat project is simple: create a de-facto interactive teaching environment for web application security. In the future, the project team hopes to extend WebGoat into becoming a security benchmarking platform and a Java-based Web site Honeypot.

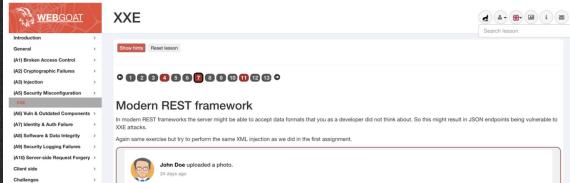

Introduction

WebGoat is a deliberately insecure web application maintained by [OWASP](#) designed to teach web application security lessons.

This program is a demonstration of common server-side application flaws. The exercises are intended to be used by people to learn about application security and penetration testing techniques.

WARNING 1: While running this program your machine will be extremely vulnerable to attack. You should disconnect from the Internet while using this program. WebGoat's default configuration binds to localhost to minimize the exposure.

WARNING 2: This program is for educational purposes only. If you attempt these techniques without authorization, you are very likely to get caught. If you are caught engaging in unauthorized hacking, most companies will fire you. Claiming that you were doing security research will not work as that is the first thing that all hackers claim.

1. Run using Docker

Already have a browser and ZAP and/or Burp installed on your machine in this case you can run the WebGoat image directly using Docker.

Every release is also published on [DockerHub](#).

```
docker run -it -p 127.0.0.1:8080:8080 -p 127.0.0.1:9090:9090 webgoat/webgoat
```

If you want to reuse the container, give it a name:

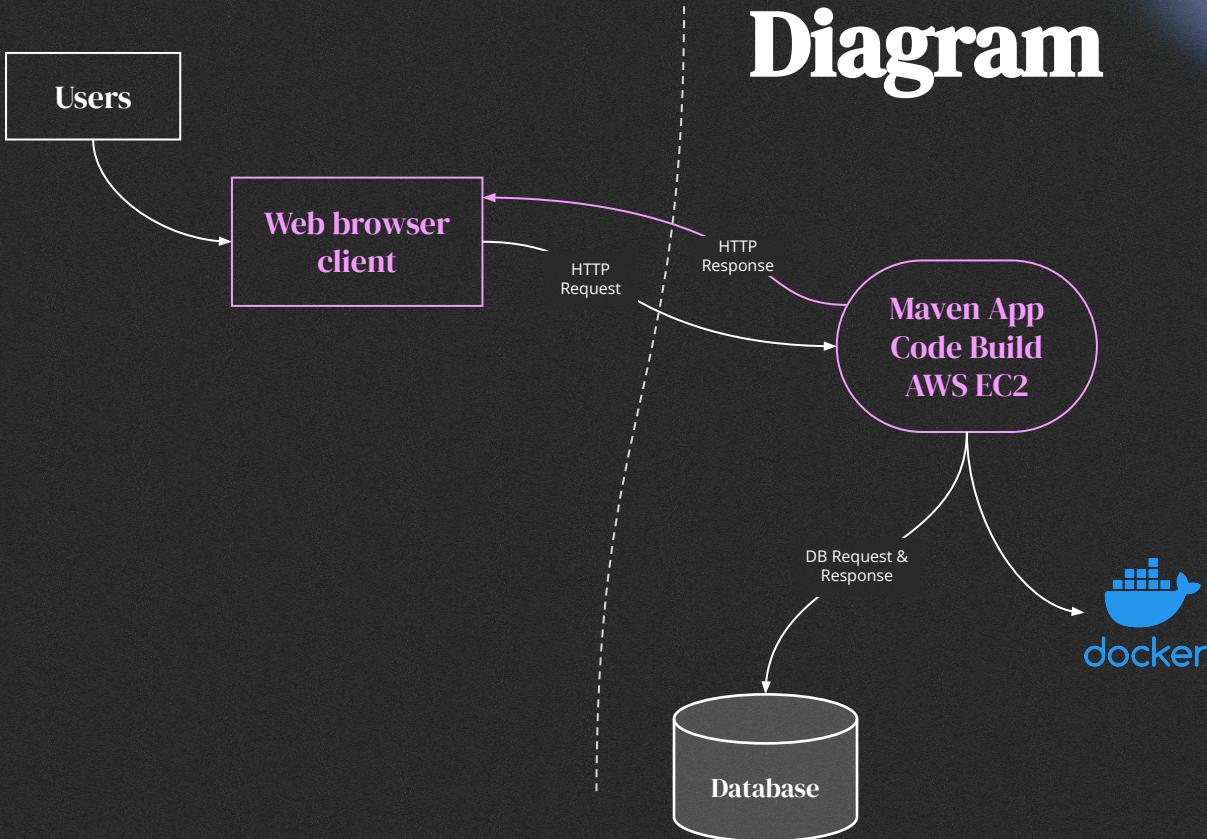

```
docker run --name webgoat -it -p 127.0.0.1:8080:8080 -p 127.0.0.1:9090:9090 webgoat/webgoat
```

As long as you don't remove the container you can use:

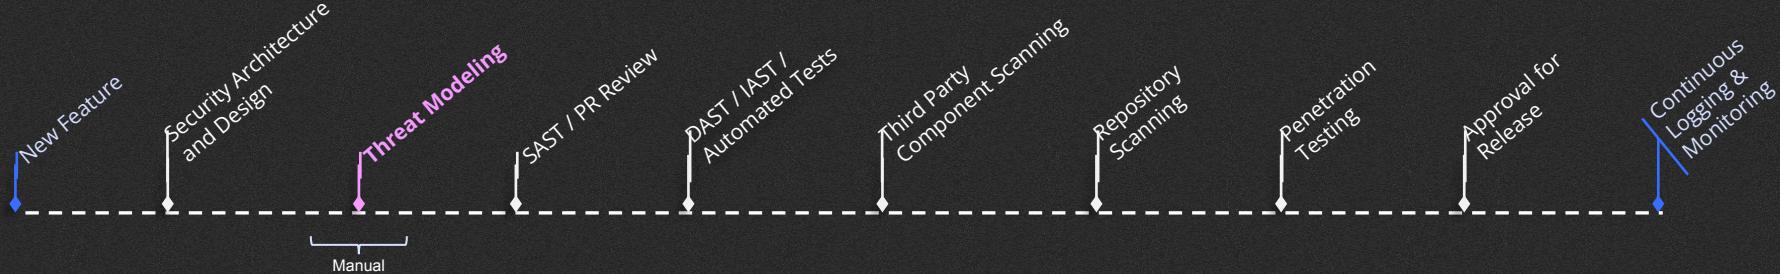

```
docker start webgoat
```

This way, you can start where you left off. If you remove the container, you need to use `docker run` again.

Securing the pipeline from end-to-end

Threat Modeling

OWASP Threat Dragon

OWASP Threat Dragon

Main Description FAQs Roadmap Releases

What is Threat Dragon?

OWASP Threat Dragon is a modeling tool used to create threat model diagrams as part of a secure development lifecycle. Threat Dragon follows the values and principles of the [threat modeling manifesto](#). It can be used to record possible threats and decide on their mitigations, as well as giving a visual indication of the threat model components and threat surfaces. Threat Dragon runs either as a web application or as a desktop application.

Threat Dragon supports STRIDE / LINDDUN / CIA, provides modeling diagrams and implements a rule engine to auto-generate threats and their mitigations.

Resources

Use the [version 1](#) or [version 2](#) documentation to get started, along with the recording of Mike Goodwin giving a [lightning demo](#) during the OWASP Open Security Summit in June 2020.

An [introduction](#) to Threat Dragon is provided by the [OWASP Spotlight](#) series, and the [Threat Modeling Gamification](#) seminar by Vlad Styran shows how using Threat Dragon can make threat modeling fun.

There are a couple of OWASP community pages that give overviews on Threat Modeling and how to get started: [Threat Modeling](#) and [Threat Modeling Process](#).

The easiest way to get in contact with the Threat Dragon community is via the OWASP Slack [#project-threat-dragon](#) project channel, you may need to [subscribe](#) first.

OWASP Threat Dragon

Desktop installation

Home > Docs-2 > install-desktop

OWASP Threat Dragon

Threat Dragon comes in two variants, a desktop application and a web application.

Desktop application install instructions

Installable versions are available for download from the [OWASP GitHub area](#):

- Windows (64 bit) installer
- MacOS installer
- Linux snap, AppImage, debian and rpm installers

Linux installer and AppImage

Packages for both Debian and Fedora Linux on AMD64 and X86-64bit platforms can be downloaded from the [releases folder](#). Alternatively a platform independent snap installer can be downloaded, or use the AppImage provided.

MacOS installer

Download the .dmg MacOS installer from the [releases folder](#). Open the download and drag 'OWASP Threat Dragon' to the application directory. When the copy has finished then Threat Dragon can be run from launchpad or from Finder -> Applications.

Windows installer

Download the Windows .exe installer from the [releases folder](#). Run the installer and invoke the application from the shortcut.

Releases Tags

Apr 20 Patch actions v2.0.2 38x5071 Compare

Version 2.0.2 (Latest)

Patch version 2.0.2 fixes a collection of bugs from version 2.0:

- Add missing threat fields and a threat number on the report
- migrate docs to OWASP project pages
- Print to PDF missing from desktop version
- Update to create a new threat model while using GH-lab as provider
- Threat IDs are updating after edit

Web application
The web application is provided as a [tar.gz file](#) or a [zip file](#) with software lists of materials (SBOMs)

Threat Model

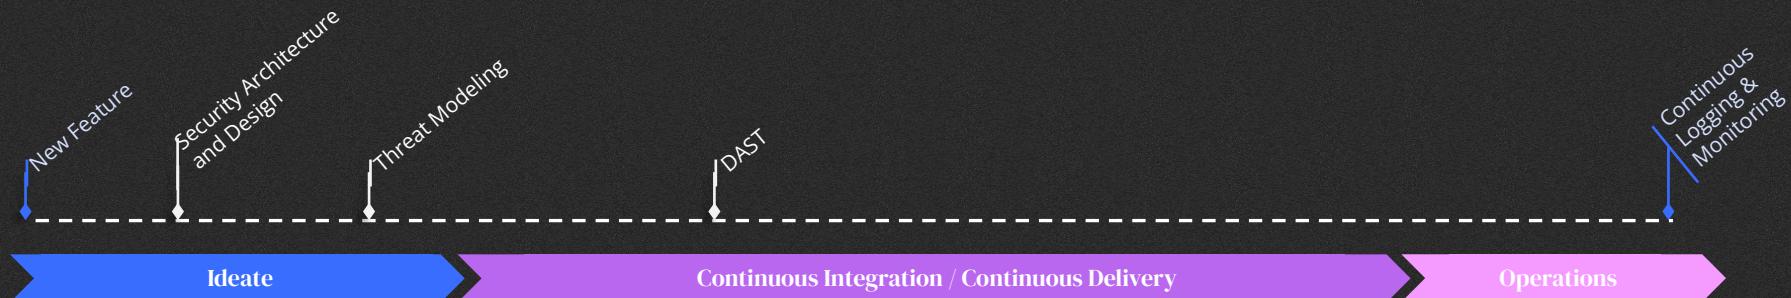

Securing the pipeline from end-to-end

Ideate to CI/CD to Operations

Securing the pipeline from end-to-end

Ideate to CI/CD to Operations

Identified Challenges & Risks

- Security flaws in the design and architecture of the application
- Slow, inefficient, and insecure deployment
- Security flaws in source code
- Lack of visibility that can make malicious behavior more difficult to detect

Processes to Mitigate Risks

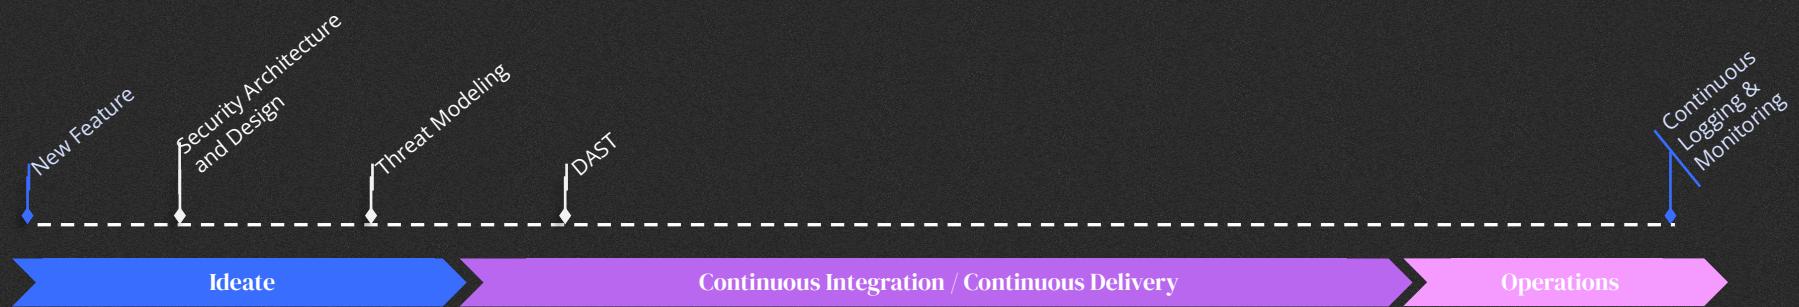

- Security Architecture & Design
- Threat Modeling
- DAST
- Continuous Logging & Monitoring

Wins 🎉

- ✓ Secure architecture and design process
- ✓ Automated Pipeline
- ✓ Automated Security Testing
- ✓ Continuous Logging & Monitoring

Securing the pipeline for this demo

Design to CI/CD to Operations

Demo

Let's set up the development environment

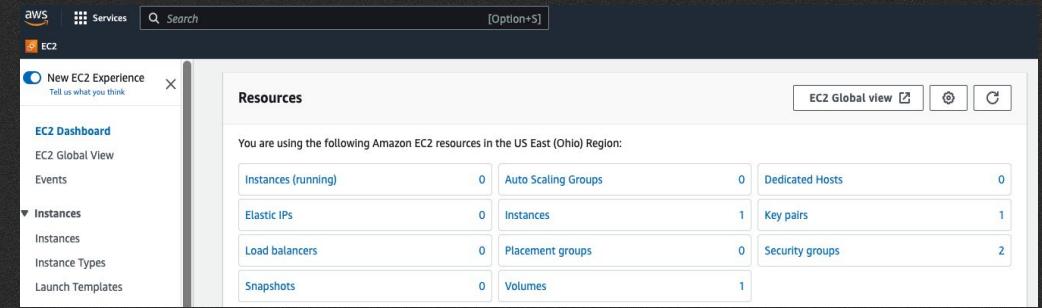

Let's set up the development environment

- Set up AWS account
- Create EC2 Instance
- Default settings
- Default VPC
- No IAM Group
- Allow all TCP access
- Launch Instance
- Connect via SSH or EC2-User

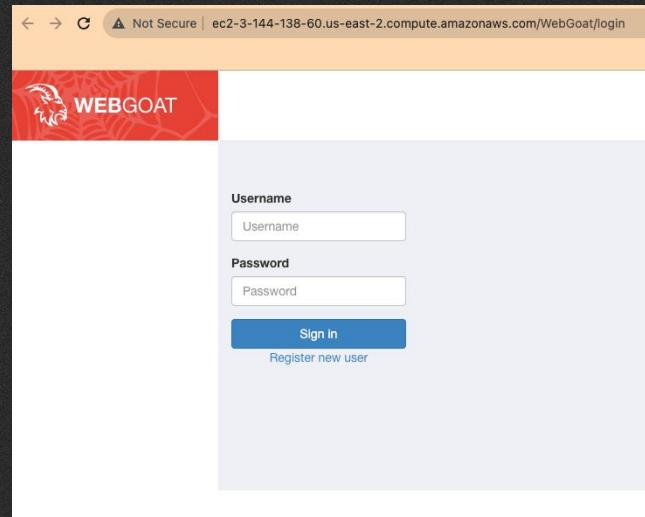

Sudo yum update -y

- sudo yum install -y docker
- sudo service docker start
- sudo usermod -a -G docker ec2user
- sudo docker pull webgoat/webgoat-8.0
- sudo docker run -p 80:8080
- (opt) docker run -p 80:8080
- Confirm access: curl -kv http://localhost
- Access WebGoat:
<http://ec2-publicip4.compute.amazonaws.com/WebGoat/Login>

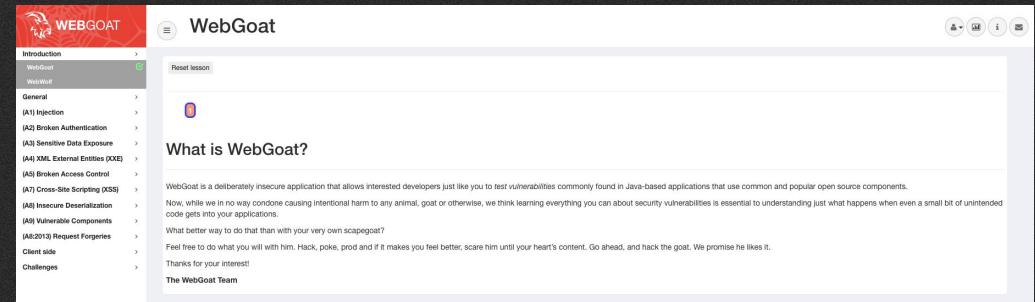

Let's set up the development environment

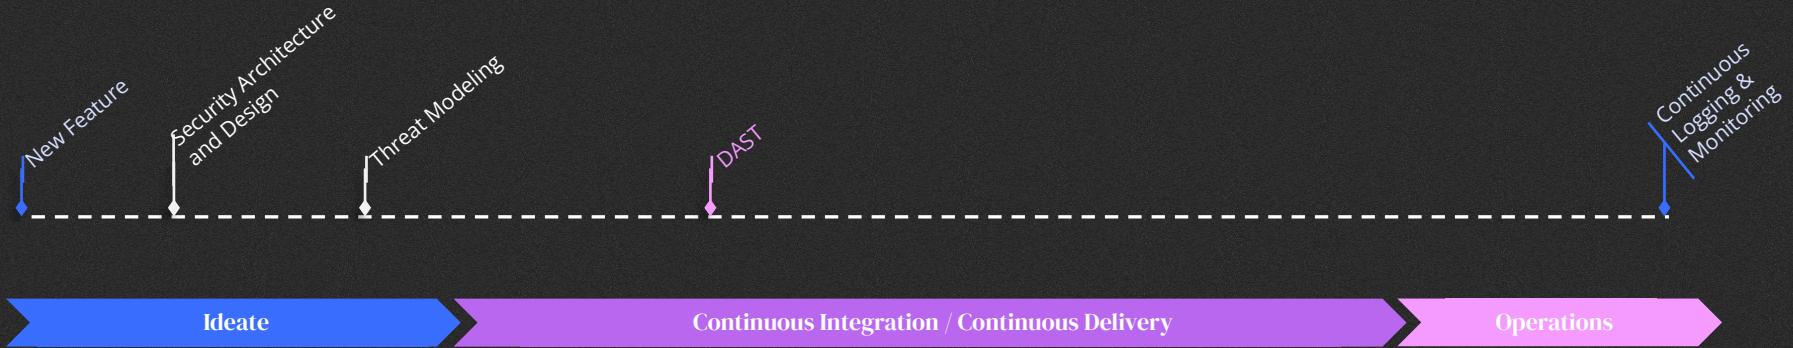

Let's set up the development environment

Let's set up the development environment ctn.

Continuous Integration / Continuous Delivery

Demo

Let's set up Gitlab

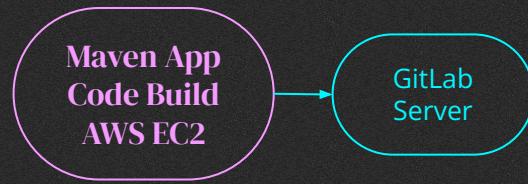

The screenshot shows the GitLab documentation website with a dark theme. The top navigation bar includes links for 'GitLab' (with a logo), 'Docs', and a search icon. A survey prompt 'Help us learn about your current experience with the documentation. Take the survey!' is visible. The main content area is titled 'Install GitLab' and specifies 'ALL TIERS SELF-MANAGED'. It contains a list of installation steps and resources:

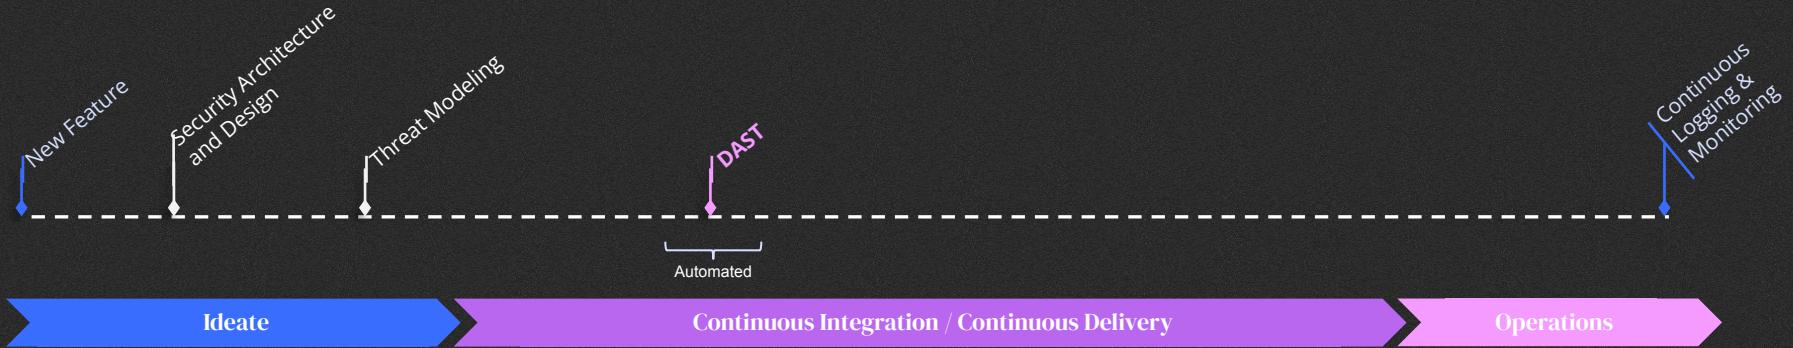

- Requirements
- Installation methods
 - Cloud providers
 - Offline GitLab
 - Reference Architectures
- Steps after installing
- Upgrade GitLab
- Install GitLab Runner
 - Configure GitLab Runner
- Administer
- Use GitLab
- AI/ML-powered features

A sidebar on the left lists other documentation categories: Home, Tutorials, Subscribe, Install (which is expanded to show the sub-sections listed above), Administer, and Use GitLab.

Setting Up and Using a GitLab Server

- Install and configure the necessary dependencies
 - sudo yum install -y curl policycoreutils-python openssh-server openssh-clients perl
- Add the GitLab package repository and install the package
 - curl https://packages.gitlab.com/install/repositories/gitlab/gitlab-ee/script.rpm.sh | sudo bash
 - sudo EXTERNAL_URL="https://gitlab.example.com" yum install -y gitlab-ee

Dynamic Application Security Testing (DAST)

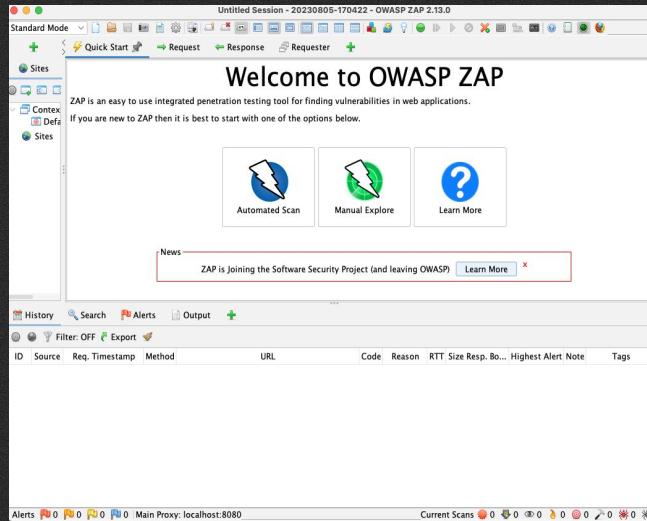

Demo

Demo

Let's talk about automation

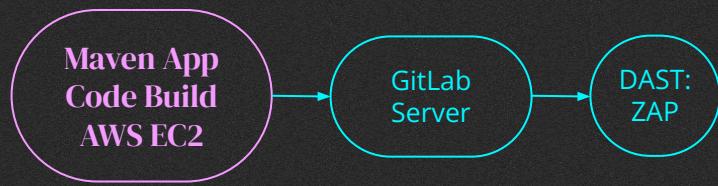

Let's set up DAST

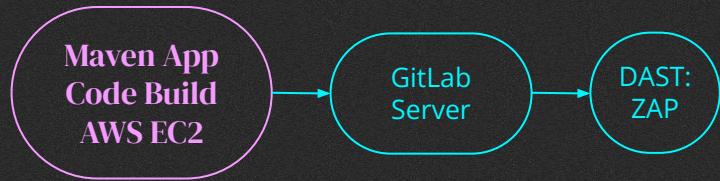

Authenticate to Web Application Scans with ZAP

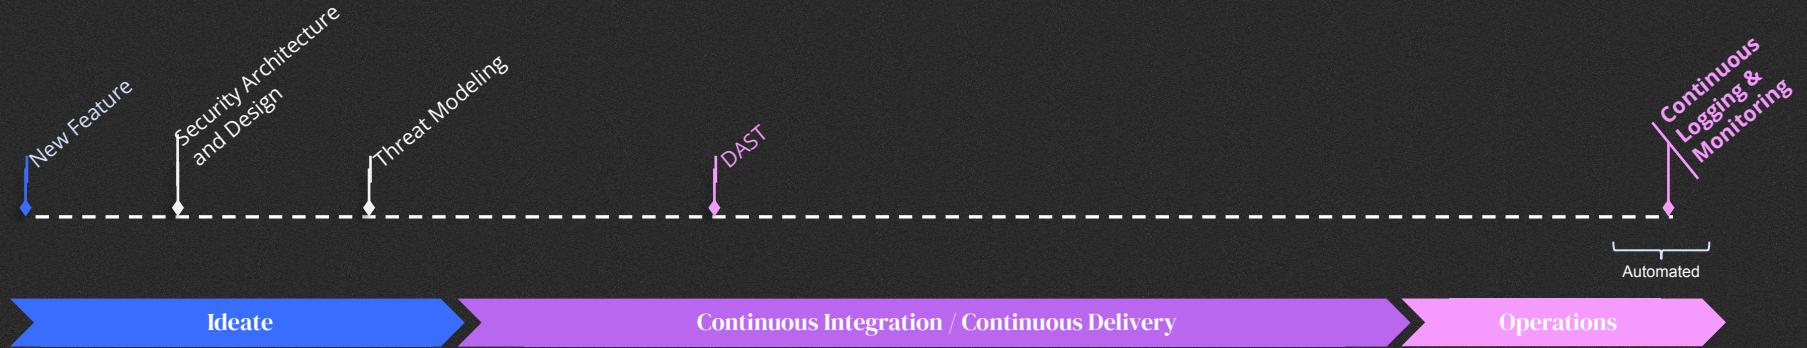

- Access ZAP
- Context > Session Properties > 1. Include in Text > Add url >
<http://ec2-publicip4.compute.amazonaws.com/WebGoat/Login> > Add
- Record Zest script > title: authentication > type: authentication >
server side script > start recording > capture logging into webgoat >
stop recording > search for post requests > session property
authentication > regex pattern identified in Logging in response
message: admin > regex pattern identified in Logged out response
message: Go to login page

Automate Web Application Scans with ZAP

- <https://github.com/zaproxy/zap-api-python>
 - pip install python-owasp-zap-v2.4
 - Create script to automate scans with ZAP API
- Next steps:
 - Trigger automated scan as part of the acceptance test script, run the CI/CD pipeline, and review results

Continuous Logging and Monitoring

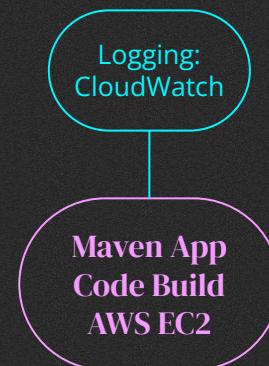

Demo

Let's talk about configuration

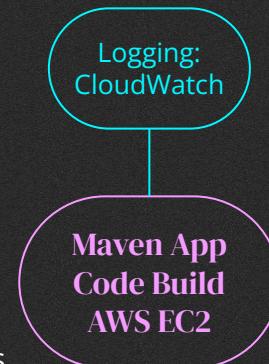

Implement CloudWatch Monitoring for an EC2 Instance

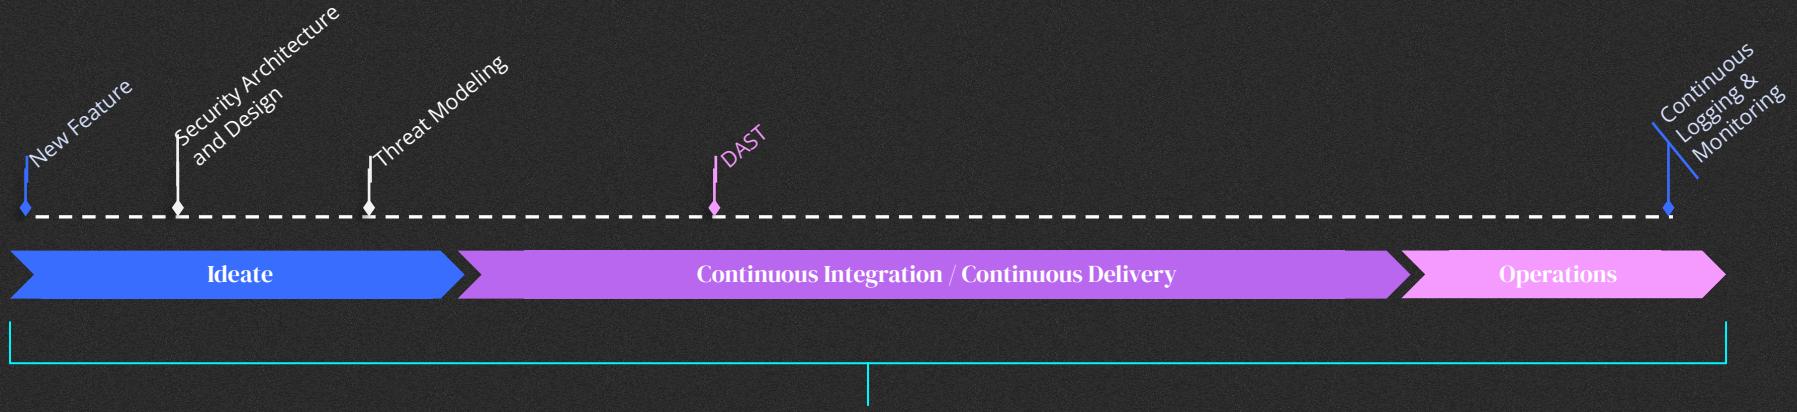

- Connect to instance
- wget -O awslog-agent-setup.py <https://s3.amazonaws.com/aws-cloudwatch/downloads/latest/awslogs-agent-setup.py>
- sudo python ./awslogs-agent-setup.py --region us-east-1
- Go to IAM > Users > cloud_user > permission policy allow_all > security credentials > create access key > select CLI > check then next > create access key > download .csv file > copy the access key ID > back to CLI > paste access key ID

Implement CloudWatch Monitoring for an EC2 Instance

- Path of log file to upload /var/log/syslog: /var/log/apache2/error.log
- Destination Log Group name: 1
- Choose log stream name: Enter Choice 1
- Choose log event timestamp form: Enter choice 1
- Choose initial position of upload: n
- Setting up agent as a daemon
- Go to CloudWatch > Log groups > /var/log/apache2.error.log > Log stream > Log events
- cat /var/log/apache2.error.log
- Command line: 'usr/sbin/apache2'

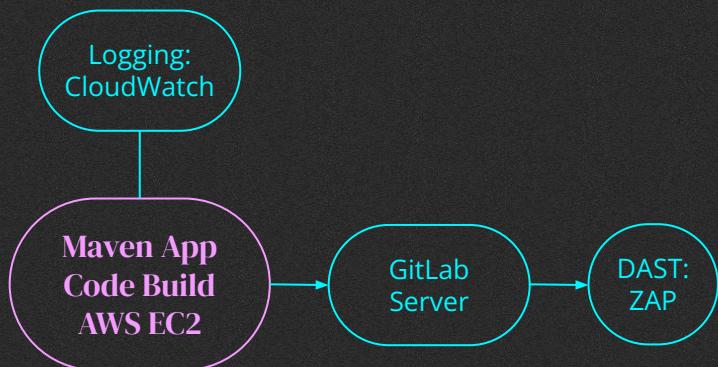

**Bringing it all together for
Continuous Integration / Continuous
Delivery**

Demo

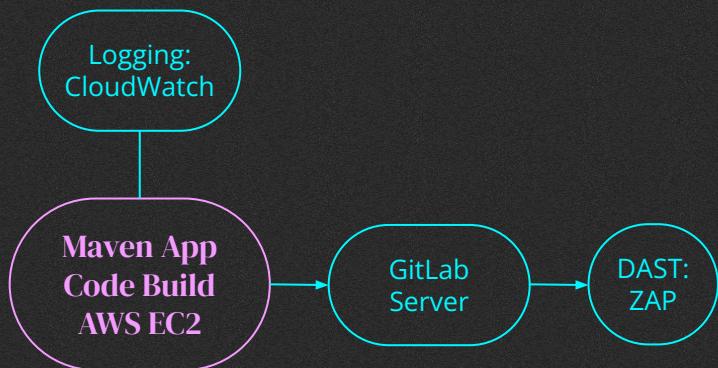

Connecting the GitLab Server to automated scans and continuous logging

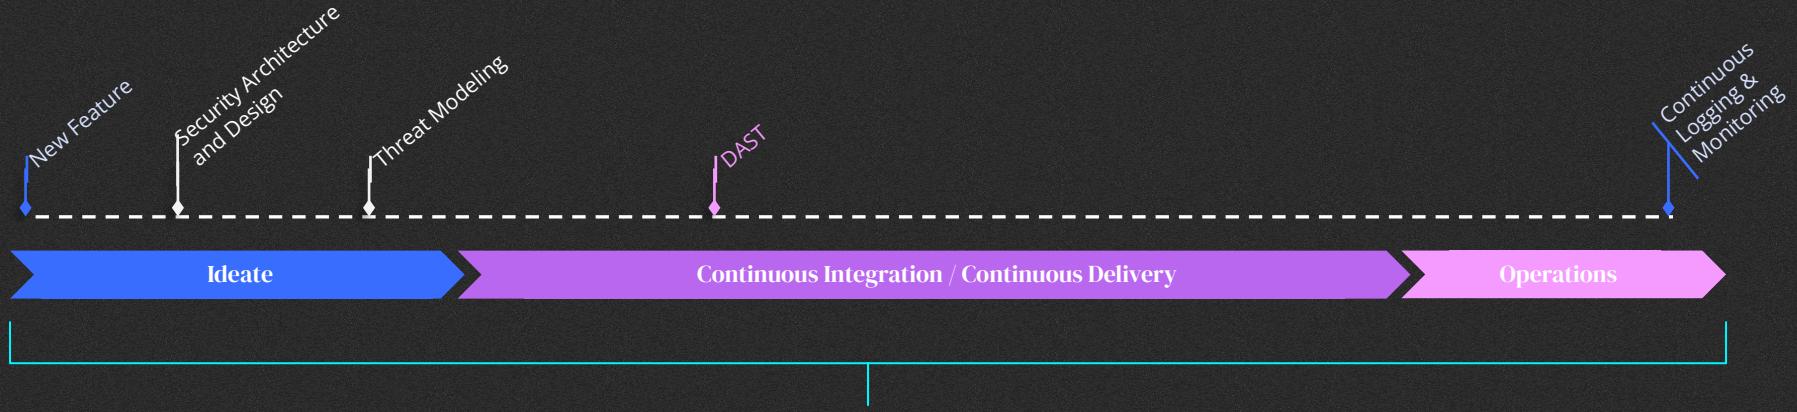

- With the GitLab Server EC2 instance up go ahead and configure GitLab Runner
- Install and configure GitLab Runner on the EC2 Instance. GitLab Runner will be responsible for executing the automated OWASP ZAP scans
- Create AWS IAM Roles
 - Create an IAM role that allows the EC2 instance running the webapp to access necessary AWS services, attack to EC2 instance
- Install and Configure ZAP on the WebGoat EC2 Install
- Create ZAP scanning scripts utilizing ZAP API

Connecting the GitLab Server to automated scans and continuous logging ctn.

- Configure GitLab CI/CD pipeline
 - The GitLab server with the WebGoat code repo create a ` `.gitlab-ci.yml` file to define the CI/CD pipeline
- Register WebGoat EC2 Instance as GitLab Runner
 - On the GitLab Server EC2 instance, register the WebGoat EC2 instance as a GitLab runner so that it can execute the CI/CD pipeline jobs
- Test the Setup
 - Push changes to your web application's repository to trigger GitLab CI/CD pipeline.
 - The pipeline should perform the automated OWASP ZAP scanning and send logs to AWS CloudWatch

Continuous Improvements and Lessons Learned

Demo

Implement continuous improvements, lessons learned, next steps, feedback, suggestions

Lessons learned:

- Don't bite off more than you can chew...
- Overestimate and buffer in more troubleshooting time than you anticipated!
- This pipeline is not exhaustive...always more to add. Threat model and focus in on different things to learn and incorporate:

Amazon Web Services:

- Lock down sec groups (inbound rules), IAM roles, restrictive VPC, EC2 Elastic Beanstalk, EKS
- Cloudwatch: more alerts, Cloudformation to trigger setup, billing alerts

WebGoat:

- Focus the automation to target OWASP Top 10 web vulns and third party components
- Try other vulnerable Web Applications like OWASP Juice Shop, AWSGoat, and Damn Vulnerable Web App on different cloud platforms like Azure and GCP

Implement continuous improvements, lessons learned, next steps, feedback, suggestions ctn.

And beyond:

- Policy as Code, Secrets Management, Third Party Component Scanning...
- AI??

Questions?

Shoutouts

It takes a village

My board of directors:

- Joseph Halpin, a passion for graphic design
- Daniel Stroie

Technical troubleshooting and mentorship:

Appendix

Threat Modeling with STRIDE

Spoofing

- Involves illegally accessing and then using another user's authentication information, such as username and password

Tampering

- Involves illegally accessing and theInvolves the malicious modification of data. Examples include unauthorized changes made to persistent data, such as that held in a database, and the alteration of data as it flows between two computers over an open network, such as the Internet

Repudiation

- Associated with users who deny performing an action without other parties having any way to prove otherwise—for example, a user performs an illegal operation in a system that lacks the ability to trace the prohibited operations. Non-Repudiation refers to the ability of a system to counter repudiation threats. For example, a user who purchases an item might have to sign for the item upon receipt. The vendor can then use the signed receipt as evidence that the user did receive the package

Threat Modeling with STRIDE ctn.

Information Disclosure

- Involves the exposure of information to individuals who are not supposed to have access to it—for example, the ability of users to read a file that they were not granted access to, or the ability of an intruder to read data in transit between two computers

DoS

- Denial of service (DoS) attacks deny service to valid users—for example, by making a Web server temporarily unavailable or unusable. You must protect against certain types of DoS threats simply to improve system availability and reliability

Elevation of Privilege

- An unprivileged user gains privileged access and thereby has sufficient access to compromise or destroy the entire system. Elevation of privilege threats include those situations in which an attacker has effectively penetrated all system defenses and become part of the trusted system itself, a dangerous situation indeed
